Excellence™

Operational Sustainability, LLC®

*Air / GHG Compliance Management*

## Air / GHG Compliance Management

Over the past few decades societal, regulatory and investor pressures have continued to ratchet up. In 1990, U.S. EPA introduced significant new reporting requirements with the Clean Air Act Amendments along with U.S. EPA Mandatory Reporting Requirements for Greenhouse Gases (EPA MRR). With increasing regulatory burden comes additional scrutiny, complexity, and cost for compliance. The **OESuite™ Air / GHG Management Module** from Operational Sustainability, LLC® (OS) can take the complexity out of the air emission calculations while providing visibility down to the asset level. Users can create emissions sources and apply emissions factors and calculations to inventory their sources. In addition, we can help you to track your emissions offset and allowance credits while integrating with your process data at the historian level.

### **The OESuite Air / GHG Module can support all aspects of your air compliance program including:**

- Decision-making regarding operating and production schedules by calculating emissions using various scenarios
- Source inventory and categorization
- NSPS excess emissions
- Greenhouse gas tracking
- Allowance management tracking and reporting
- Deviation alerts and other notifications
- Source level emissions from equipment
- User-defined calculations that including production data or hours of operation
- AP-42 emissions factors library
- What-If scenarios
- Control device contaminant removal
- Integrity Operating Windows based on tags
- Permit information and limits
- Data validation and locking
- Ad hoc reporting system
- Key Performance Indicators (KPIs) with limit indicators
